

SCI-OCR Mixed Content Fixture

This page combines section headings, dense prose, a data table, and rendered mathematical notation. It is designed to exercise layout routing before a real OCR backend is available.

1. Methods

The synthetic experiment contains repeated visual structures and controlled vocabulary so that future OCR output can be compared against stable expectations without using private documents.

Sample	Temperature	Yield	Notes
A-01	21 C	78%	baseline
B-02	37 C	91%	heated
C-03	42 C	88%	replicate

Formula block

$$E = mc^2$$
$$a^2 + b^2 = c^2$$
$$\int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$$

2. Visual Regions

This second page contains an embedded image and a simple chart. The current pipeline should route these regions to the future vision worker instead of sending them to OCR.

Figure 1. Embedded synthetic image for future vision tests.

Chart 1. Synthetic extraction benchmark with five bars.

Chart 2. Classic line graph with axes and curve.
